The glass transition temperatures T_g for the polymers I, II, III, and IV were found to be ~ -50 , -25 , -20 , and $+45^\circ\text{C}$, respectively. After heating to 200°C for 30 min, the polymers II, III, and IV do not flow even at 500°C , only the polymer I flows at about 100°C . Toluene and ten times the calculated amount of water were filled into a four-necked flask. A solution of alkyl-(aryl-) chlorosilane in toluene was added from the dropping funnel by stirring. Temperature rose on addition of BAPT. The toluene layer was separated from the water, washed out until neutral (litmus), and distilled in vacuo. The yellow polymers dissolved readily in alcohol,

benzene, toluene, acetone, and carbon tetrachloride. The yield was 30% for poly-bis-(acetylacetone) titanodimethylsiloxane, 40% for poly-bis-(acetylacetone) titanodiethylsiloxane, and 38% for poly-bis-(acetylacetone) titanomethylphenylsiloxane. Cohydrolysis of alkyl-(aryl-) chlorosilanes with BADT in the presence of pyridine gave: 57.6% for poly-bis-(acetylacetone) titaniumdimethylsiloxane; 70.5% for poly-bis-(acetylacetone) titanodiethylsiloxane; 62% for poly-bis-(acetylacetone) titanomethylvinylsiloxane; and 63.8% for poly-bis-(acetylacetone) titanomethylphenylsiloxane. The authors thank N. A. Chumayevskiy for taking the infrared spectra, and G. L. Slonimskiy, Head of the Laboratoriya issledovaniya polimerov (Laboratory for Polymer Research), for thermo-mechanical measurements. B110/B101

In the polymer, the Si:Ti ratio was always higher than that of the initial substances. Cohydrolysis of bis(acetylacetone) dichloro titanium with methyl trichloro silane yielded maximum, poly-bis(acetylacetone)titano phenyl siloxane (I) minimum ratio. The osmometrically determined molecular weight of I was 103,000. All polymers showed, in the infrared spectrum, absorption bands for Ti-O in the Ti-O-Si group, and complete absorption for Si-O in the Si-O-Si group. Analyses and investigations of properties of I, poly-bis(acetylacetone)titano methyl siloxane (II), and poly-bis(acetylacetone)titano ethyl siloxane (III) showed cyclolinear structure with oxygen-bound chains of eight- or six-membered rings. The viscosity in benzene was 0.073 for I; 0.069 for II; 0.0670 for III. The yellow, film-forming polymers were structurized at 100, 160, and 200°C; they became unsoluble except for I which was partially soluble even after 4 hr heating at 200°C. In this case, their thermomechanical properties correspond to those of structurized polymers. The structure of II and III is an intermediate stage between crystalline and amorphous structures, only I is amorphous. The OH groups were determined according to Terent'yev. The infrared spectra were taken at the opticheskaya laboratoriya INEOS (Optical Laboratory of INEOS) headed

PERIODICAL

Vestnik Akademii Nauk 1957 Vol 27, Nr 1, pp 115-116*

Reviewed: V/1957

ABSTRACT

Received: V/1957
From the 22 to the 31 October 1956 the forth conference of
directors of branch libraries and directors of other institutes
connected with the Academy of Science of the USSR was held at
Moscow.

In his opening address, A.I. Gorbanew, doctor of technical
science and vice president for the coordination of scientific
work performed by the Academies of the Republics of the Soviet
Union and their branches in the USSR, outlined the tasks to
be performed by the Academy of Science of the USSR and
characterized the part to be played by the various Academies
and their branches with respect to the planning of scientific
problems. He pointed out the necessity of improving bibli-
graphical work, above all with respect to catalogues. He
suggested that a wider scope be given to the exchange of books
and microfilms among libraries and also that the standard
of education librarians be improved.

CARD 1/3

PA - 2483

The Tasks to be achieved by the Libraries of the Branches
of the Academy of Science of the USSR.
(Sadatschi bibliotetschnoj raboty w filialach akademii nauk
S.S.R. Russian)

The activity of libraries must be on an equal footing with that
of scientific institutes and must be under the direct super-
vision of the president of the respective branch library. The
report delivered by W.I. Abramowa, director of the department
of special libraries, dealt with the aid to be rendered by
libraries to their branches in dealing with scientific problems.

The basic stock of books of branch libraries have incre-
ased by 1/3 in the course of 3 years. It is, however, pointed
out that in the case of numerous libraries there have not been
sufficient supplies of new foreign books.

Some libraries in the East, as eg. in Karelia and else-
where, scientific research institutes and also the biological
institutes of branch libraries in the Ural have stocks which
have as yet not been sufficiently well examined. The systematical
and alphabetical catalogues and book lists of nearly all
libraries are in sore need of being re-edited. Bibliographical
work is not satisfactory, and its level is not up to the

standards of scientific institutes. There is lack of co-
ordination among branch libraries and other institutes of the
Academy of Science, public libraries and military libraries.

In the course of further discussions an increase of sub-
ventions for the purchase of new books and a more intense
utilization of existing stocks, including foreign stocks, was
demanded.

TITLE:

The preparation of surfaces for plating

PERIODICAL: Referativnyy zhurnal, Mashinostroyeniye, no. 5, 1962, 38, abstract 5B216 ("Mashinostr. i energ. Kazakhstana. Nauchno-tekh. sb.", no. 4 (14), 1961, 29-30)

TEXT: An advanced technology of the surface preparation which renders the sandblasting of the parts unnecessary is described. The degreasing is carried out by an electrochemical method on alternating current with the application of OP-10 (OP-10) and OP-7 (OP-7) emulsifiers. This method of degreasing has been proposed by P. P. Belyayev and M. Fedorova. Thereby the coefficient of utilization of electric power increases nearly by a factor of 3, the efficiency of the baths increases and the risk of hydrogenization is absent. The application of alternating current has relieved workers of a continuous attendance of the baths and cut by several times the duration of degreasing. For degreasing with the application of alternating current the following solution is used: caustic soda (10 g/l), calcined soda (25 g/l), sodium triphosphate (25 g/l) OP-7, OP-10

X

Card 1/2

The preparation of surfaces for plating

A052/A101

emulsifier (5-10 g/l). The temperature of the bath = 70°C, the cathode current density = 10 a/dm², voltage = 12-15 v. The duration of the process is 0.3 - 2 min with an obligatory air stirring. After degreasing a more careful, than at the usual method, rinsing in hot water is necessary to remove the thin firmly sticking film, which can cause the scaling of the coating. A mixture of sulfuric and hydrochloric acid with an addition of KC (KS) inhibitor is used for steel etching. The composition of the solution: 50% hydrochloric acid, 10% sulfuric acid and 0.3 - 5 g/l KS; the bath temperature = 45 - 60°C. The introduction of the new technology has enabled one to change over 500 type-dimensions of parts to hot etching. Thereby 2 electrolytic degreasing baths of 600 l each are used for 12 fast zinc plating baths and 8 baths for other kinds of coatings.

TITLE: Reaction of titanium dioxide with hydrofluoric acid

PERIODICAL: Akademiya nauk SSSR. Izvestiya. Otdeleniye khimicheskikh nauk, no. 3, 1962, 388-392

TEXT: The solubility of titanium dioxide in hydrofluoric acid, and the composition of the compounds formed in the solid phase and in solution were determined. The TiO_2 (~0.5 % impurities) dissolved in HF, was stirred, together with the solid phase, for 24 hrs at $25^{\circ}C$. In order to control the equilibrium obtained, saturated solutions of TiO_2 in HF were kept for three months in the exsiccator over KOH. When removing HF and H_2O from the solution, a solid phase was separated which was stirred in the thermostat together with the solution, and analyzed for Ti- and HF content. Ti was reduced by means of Zn-Hg, brought into ferric sulfate solution and titrated by means of $KMnO_4$. HF in the presence of Ti was determined

Card 13

S/062/62/000/003/003/014
B110/B101

Reaction of titanium dioxide with...

potentiometrically. To reduce the solubility of K_2TiF_6 , 4-6 ml C_2H_5OH were added besides KF. The solubility of TiO_2 increases almost linearly with the HF concentration. In saturated solutions, the molar ratio of fluorine varies between 4.01 and 4.33, as $[TiOF_4]^{2-}$ was formed in the solution. The first solid phase is about TiO_2 . At 25.95-39.60 % of HF, $TiOF_2 \cdot H_2O$ is formed. In a solution with the ratio F: Ti = 4, a change of the particle number from 1.45 to 1.22 was determined cryoscopically.

Concentration dependence and dissociation point towards

$TiF_4 + 2H_2O \rightleftharpoons [TiF_4 \cdot 2H_2O] \rightleftharpoons H^+ + [TiF_4(OH)H_2O]$. The degree of dissociation of hydrated TiF_4 agrees with the electric conductivity of titanium solutions of the ratio F/Ti = 4.2. The steep rise of the molar conductivity with the ratio F:Ti is explained by the following equilibrium:

Card 2/3

S/062/62/000/003/003/014
B110/B101

Reaction of titanium dioxide with...

concentration 0.5 and 0.22 mole/liter TiF_4 were titrated conductometrically. A well marked break in the curve of conductometric titration at the ratio $F/Ti = 5$ proves the formation of pentafluorotitanic acid $H[TiF_5 \cdot H_2O]$. The conductivity increase at $F/Ti > 5$ occurs owing to formation of hexafluorotitanic acid, which decomposes according to: $[TiF_6]^{2-} \xrightleftharpoons{H_2O} [TiF_5 \cdot H_2O]^- + F^-$.

There are 3 figures and 3 tables.

TITLE: Hydrolysis of tungsten hexafluoride

SOURCE: AN SSSR. Izvestiya. Neorganicheskiye materialy, v. 1, no. 3, 1965, 316-320

TOPIC TAGS: tungsten hexafluoride, tungsten coating, solubility, hydrolysis

ABSTRACT: Solubility of the HF-WO₃-H₂O system was studied under isothermal conditions (25°C) and the solubility diagram for the system was drawn (see fig. 1 of the Enclosure). The study was made in order to learn more about the hydrolytic properties of tungsten hexafluoride (WF₆) which has a practical application in preparing tungsten metal coatings by means of depositing WF₆ vapors. On the basis of the detected compounds the following intermediate stages of hydrolysis of the HF-WO₃-H₂O system were established: H₂WO₄ (from 0 to 4% of HF), a solid phase of changeable composition, a WO₂• b WO₃• c HF• d H₂O (from 5.7 to 25.4% of HF), and WF₆-H₂WO₂F₄ (from 25.8 to 38.1% of HF) exists in solution. The equilibrium WO₂F₂ + 2HF ⇌ H₂WO₂F₄. At HF to WO₃ ratios higher than 6 to 1 the molar electrical conductivity sharply increases which indicates a shift of the equilibrium toward formation of H₂WO₂F₄. At high dilution (about $\pm 10^{-2}$ mol/l) H₂WO₂F₄ decomposes with formation of tungstic acid

AUTHOR: Busluyev, Yu. A.; Davidovich, R. L.; Bochkareva, V. A.

TITLE: Pyrohydrolysis of complex fluorides of titanium, zirconium, niobium, tantalum, molybdenum, and tungsten 27

SOURCE: AN SSSR. Izvestiya, Neorganicheskiye materialy, v. 1, no. 4, 1965, 483-490

TOPIC TAGS: fluoride, pyrolysis, hydrolysis, rare metal research

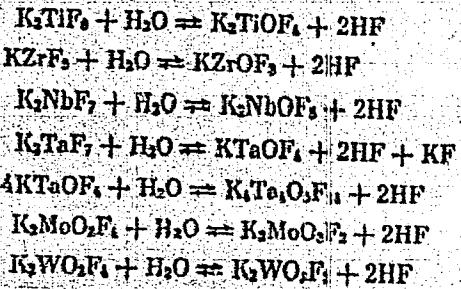

ABSTRACT: The authors studied the interaction of water vapor with K_2TiF_6 , $KZrF_5$, K_2ZrF_6 , K_3ZrF_7 , K_2NBF_7 , $K_2MoO_2F_4$, and $K_2WO_2F_4$ at 200-400°C. The reactions between the fluorides and water vapor are reversible and are characterized by the partial pressure of the HF produced, which was measured. The equilibrium constants were calculated by determining the stoichiometry of the reactions tensimetrically. The process of pyrohydrolysis of the complex fluorides is represented by the following

Cord 1/3

L 55952-65

ACCESSION NR: AP5014077

reaction equations:

In the process of hydrolysis, the substitution of oxygen for fluorine is associated with the linking by oxygen of the transition metal atoms Ti, Zr, Ta, Mo, and W into -M-O-M-O- chains with a double M=O bond. The partial vapor pressure of HF in the mixture with water vapor at 400°C decreases in the order $\text{ZrF}_4 > \text{KZrF}_5 > \text{K}_2\text{ZrF}_6 > \text{K}_3\text{ZrF}_7$, owing to the screening effect of fluorine, which hinders the hydrolysis of zirconium. "The authors express their appreciation to Yu. Ye. Gorbunova and S. M. Kremer for the x-ray phase analysis of the complex fluorides." Orig. art. has: 4 figures and 2 tables.

TITLE: Investigation of the pitting and crevice corrosion of stainless steels in sea water

SOURCE: Korroziya metallov i splavov (Corrosion of metals and alloys), no. 2
Moscow, Izd-vo Metallurgiya, 1965, 315-331

TOPIC TAGS: stainless steel, chromium steel, corrosion, sea water corrosion, sodium chloride/Kh18N12M2T (EI-448) Cr-Mo steel, Kh18N12M3T (EI-432) Cr-Mo steel, Kh18 Cr steel, Kh17 Cr steel, Kh13 Cr steel, 18-8 stainless steel

ABSTRACT: This investigation was performed with the aid of a specially developed setup for potentiostatic polarization measurements of the electrochemical behavior of stainless steels in NaCl solutions simulating sea water (Fig. 1). In the electrolytic cells the experiments were performed on a rotating disk electrode, with Pt used as an auxiliary electrode. The electrode potential was measured with respect to a saturated calomel half-cell. With the aid of an electronic potentiostat specified values of the potential were assigned to the working electrode, after which

the intensity of the current passing through the electrolytic bath was determined. This made it possible to investigate the patterns of disturbances in the passivity of the steel specimens, leading to localized corrosion based on the mechanism of the pitting (anodic) and crevice (cathodic-acid) activation of the passive state of the investigated steels. It is shown that in such NaCl solutions the anodic disruption of passive state of steels of the Kh13 and Kh18 types owing to chemical polarization by the oxygen of air may already be achieved in the neutral solution (pH = 7); of steels of the 18-8 and Kh17 type, in weakly acid solutions (pH = 4); whereas for Kh18N12M3T (EI-432) and Kh28 steels, as well as for pure Cr, it is not achieved in sufficiently acid solutions (pH = 3), even on contact with Pt. Further, it is found that pure Cr and high-Cr Kh28 steel, which are highly corrosion-resistant in the event of anodic activation of passive state (pitting), display a low corrosion resistance in the event of cathodic-acid activation, i.e. crevice corrosion. The experiments also confirmed that, of the stainless steels investigated, the molybdenum steels Kh18N12M2T (EI-448) and Kh18N12M3T (EI-432) display the highest resistance to pitting and crevice corrosion in sea water. TITLE: Effect of ozone on the corrosion of stainless steel in nitric acid solutions

SOURCE: Korroziya metallov i splavov (Corrosion of metals and alloys), no. 2
Moscow, Izd-vo Metallurgiya, 1965, 161-165

TOPIC TAGS: austenitic stainless steel, ozone, corrosion, nitric acid/1Kh18N9T
Cr-Ni austenitic stainless steel

ABSTRACT: While it is generally assumed that ozone, being a strong oxidizing agent (in the acid solution the redox potential of ozone is 2.07 v for the reaction $O_3 + 2H^+ + 2e = O_2 + H_2O$), affects markedly the corrosion of metals and alloys in HNO_3 , the literature contains little information on the effect of ozone on the corrosion and electrochemical behavior of metallic materials in aggressive media. In this connection, the authors investigated the effect of various concentrations of ozone on the corrosion of 1Kh18N9T and 18-8 Cr-Ni austenitic stainless steels in HNO_3 by blowing ozonized oxygen through the solution, with the plotting of polarization curves by the galvanostatic method, on referring all the potentials to the normal hydrogen electrode. It was found that in ozonized HNO_3 solutions with concentrations

Card 1/3

I-28401-66

ACC NR: AT6013795

of up to 70% at up to 100°C the corrosion of austenitic Cr-Ni steels at first passes through a minimum corresponding to ~20% HNO₃ due to the lower solubility of ozone in HNO₃ of this concentration, but subsequently it increases above normal, particularly in highly concentrated (>55%) HNO₃ solutions; this increase in corrosion rate is more marked when the ozone concentration in the solution is raised from 0.5 to 7%, particularly under the film of the acid solutions. To elucidate the mechanism of this effect of ozone, the electrochemical behavior of the steels was investigated. Findings: the increase in the temperature, ozone content, and concentration of HNO₃ solutions causes the normal hydrogen scale potential of the stainless steel to shift in the direction of much higher plus values (+1.25 v and higher), sufficient to disturb the passive state of the steel and thus to intensify the dissolution of the steel. Ozone is an effective depolarizer of the cathodic process and it facilitates this process; as a result, a weak anodic polarization -- which is the most dangerous from the standpoint of corrosion -- is observed (Fig. 1). O

next line is then set and the comparator reading again fixed. The measurement accuracy in the proposed system is not less than 0.01 mm. For a precision measurement of the Wulff-Bragg angles it is necessary to take into account the profile of the photometric curve of the diffraction line. To this end, it is recommended to record the photometric curve with an EPP-09 electronic automatic recording potentiometer. G. Gurskiy.

TITLE: Properties and methods of making rayon filaments

SOURCE: Khimicheskiye volokna, no. 6, 1965, 3-9

TOPIC TAGS: synthetic fiber, organic synthetic process, textile, textile engineering, textile industry machinery

ABSTRACT: Various patented processes for obtaining viscose fibers similar to cotton were evaluated. Basic technological parameters were worked out for a 1-bath and 2-bath method of forming and drawing xanthogenate filaments. Requirements for construction of spinning equipment were determined. Viscose filaments whose physical-mechanical properties compared to those of foreign rayon filaments of average strength were obtained on pilot equipment. Orig. art. has: 5 tables.

TITLE: Kinetics of the surface electrical conductivity of quartz
in the presence of adsorbed organic layers

PERIODICAL: Kolloidnyy zhurnal, v. 24, no. 4, 1962, 467 - 470

TEXT: The surface conductivity of quartz was measured with adsorbed layers of heptanol, butanol, or nonane. Adsorption was effected by evaporating the test substance and introducing it through an Hg U-seal into the quartz measuring cell, thus eliminating the effect of vapors from the lubricants required for cocks. For the same reason the quartz-cell was cleaned by heating to 350°C and evacuating to $2 \cdot 10^{-6}$ mm Hg. Results: (1) Saturated butanol vapor (5 mm Hg at $+20^{\circ}\text{C}$) produced a rapid increase in conductivity ($\sim 60 \cdot 10^{-15}$ ohm) in the first seconds and then a slow drop; after ~ 30 min a constant value was reached ($10 \cdot 10^{-15}$ ohm). (2) With butanol vapor at 0.07 mm Hg and -30°C , the constant value was reached after 3 min. (3) Heptanol (1 mm Hg, 20°C) had a similar effect. (4) Nonane vapor had no

"Peripelvic Kidney Cysts."

Budapest, Magyar Sebeszet, Vol XVI, No 3, June 1963, pages 197-200.

Abstract: [Author's German summary] The authors report tha case of a 45 year-old woman who complained of violent pains around the left kidney. Examinations indicated a renal tumor. During surgery, however, only a small pyelonephritic kidney was found with a cyst-like structure visible in the hilus. After the removal of the kidney, the structure proved to be a peripelvic kidney cyst. The most important informations concerning this problem are discussed in the article. All Western references.

"prostatectomy in Advanced Old Age"

Budapest, Magyar Sebeszet, Vol 19, No 3, Jun 66; pp 189-196.

Abstract: Author discusses his experiences with prostatectomies carried out in patients who have completed their 80th year. Of a total of 1132 prostate patients 999 were less than 80 years old and 133 were older than 80. Of the first group 780 were operated on, with a mortality of 3%; of the latter group 72 were treated surgically, with a mortality of 11%. Of the patients older than 80 who were not treated surgically 19% died while in the hospital. Author's oldest patient was 91 years old. The indications for the operation are the same in old age as in the younger age group, but postoperative treatment requires more care and greater consideration. (10 References, mainly Hungarian).

(A. D. Bochkov, *Zhur. Priklad. Khim.* 26, 681-6, 1953).
Crystal size affects the light-fastness of Pb chromate. To
increase the light-fastness, Pb chromate should be obtained
under conditions favoring the formation of large crystals.
This can be achieved by partial or complete substitution of
AcOH with HNO₃. There is some evidence that color
change is due to decompr. into Pb oxide and Cr³⁺.
V. N. Bednarski

PHASE I BOOK EXPLOITATION

SOV/3164

Bochkov, Aleksandr Dmitriyevich, Candidate of Technical Sciences

Okrashivaniye detaley v elektricheskem pole (Painting of Parts in an Electric Field) Moscow, Mashgiz, 1958. 47 p. 6,000 copies printed.

Tech. Ed.: G.V. Smirnova; Managing Ed. for Literature on Metalworking and Instrument Construction: R.D. Beyzel'man, Engineer.

PURPOSE: This book is intended for workers in paint shops.

COVERAGE: The book deals with the application of a high-voltage electric field for electrically charging fine droplets of sprayed paint for the purpose of precisely directing the spray to an article to be painted. Equipment is described, and operating principles are explained. There are 23 references: 17 Soviet, 4 English, and 2 German.

Card 1/4

Painting of Parts (Cont.)

SOV/3164

Ch. III. Subassemblies of Equipment for Electric Painting of Parts	29
1. Description and design of the painting chamber	29
2. Exhaust system	31
3. Overhead conveyor	32
4. Device for atomizing paint	33
5. Electrical equipment	35
Ch. IV. Calculations and Recommendations for the Process of Electric Spraying	40
1. Determination of distance between parts and conveyor speed	40
2. Determination of paint consumption	41
3. Determination of electric-power and compressed- air consumption	41
4. Order of hanging parts on conveyor	42
5. Suggestions for atomizing paint and for care of painting-chamber equipment	43
6. Safety rules for electric painting	44

TABLE OF CONTENTS:

Introduction.	3
Ch. I. Installations for Painting Parts in an Electric Field [Electric Spray Method]	7
1. Device with air atomization of paint	7
2. Devices utilizing bell- (cup-), disk-, and pan-type electric sprayers	10
3. Device for removal of tears from painted parts by using an electric field [Detearing Process]	14
Ch. II. General Information on the Theory of the Electric Spray Method	17
1. Basic properties of an electric field affecting the painting process	17
2. Properties of a corona discharge and its effect on electric spraying	19
3. Effect of various factors on the completeness of deposition of the sprayed paint	22
4. Effect of various factors on the uniformity of the coating	26
